Customer Journey Map: Network Request Management Portal

Automated Network Request Management in ServiceNow

Date: 10 October 2026 **Scenario:** Submitting, approving, tracking, and fulfilling a network service request

SCENARIO	**Entice** How does someone initially become aware of this process?	**Enter** What does the person experience as they begin the process?	**Engage** In the core moments in the process, what happens?	**Exit** What does the person typically experience as the process finishes?	**Extend** What happens after the experience is over?
Steps What does the employee typically experience?	Employee identifies the need for a new network connection or a change to an existing connection.	Opens the ServiceNow portal and locates the Network Request catalog item.	Selects the connection type, enters request details, and submits the form.	Receives submission confirmation and the request number, when configured.	Checks request status and receives updates until fulfilment or closure.
Interactions What systems or people do they interact with?	Colleagues, IT support team, or internal service information.	ServiceNow portal, Service Catalog, and Network Request form.	Catalog variables, mandatory-field validation, dynamic Existing ID field, and submit action.	Request record, approval workflow, and email notifications, when configured.	Request status, approval records, notifications, and network fulfilment team.
Goals & motivations What is the employee's goal at this step?	Find a clear and reliable way to request network services.	Understand where to submit a request and what information is needed.	Provide accurate information without unnecessary effort or confusion.	Know that the request has been recorded and understand the next steps.	Track progress and receive the required network service without repeated follow-ups.
Positive moments What works well?	A centralized request process is easy to understand.	The Network Request item is clearly organized under Network services.	Clear fields and dynamic visibility help users enter relevant information.	A request number and confirmation are available after successful submission.	Status views and notifications improve visibility into request progress.
Negative moments What is frustrating or slow?	The employee may not know which team handles the request.	The catalog item may be difficult to locate or understand.	Missing information or unclear field labels may cause submission errors.	Approval delays or missing notifications may leave the employee uncertain.	Limited status visibility or delayed fulfilment may require manual follow-ups.
Areas of opportunity How might we improve this step?	Explain available network services and how to request them.	Use a clear Network category and descriptive catalog item.	Use mandatory fields, clear instructions, and UI Policies to simplify the form.	Automate record creation, approval routing, and notifications with Flow Designer.	Provide useful status views, timely notifications, audit history, and future integrations.
