Project Design Phase-II

Data Flow Diagram & User Stories

Date	12 October 2026
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	4 Marks

Data Flow Diagrams:

A Data Flow Diagram (DFD) visually describes how information enters, moves through, is processed by, and is stored in a system. The following diagram represents the planned data flow for this ServiceNow project.

Simplified Data Flow Diagram

Requester Employee / Service Portal user	**Network Request Catalog** Form fields and conditional input	**Flow Designer** Get Catalog Variables Create Record
Provides connection type, contact details and request information	Submitted catalog request / Requested Item	**Network Database** u_network_database Request details and status
Approver Approve / Reject	**Email Notifications** Requester and relevant team	**Network Team** Fulfilment and status tracking

Data Flow Explanation

1. The requester opens the Service Portal and selects the **Network Request** catalog item.
2. The requester enters the configured variables, such as Requested For, Mobile Number, Type of Connection, Total Amount, Mode of Payment, and Address. Existing ID is displayed when Type of Connection is Existing, according to the UI Policy.
3. On submission, the Service Catalog trigger starts the Flow Designer flow and retrieves the catalog variables.
4. The flow creates a record in the custom Network Database table (**u_network_database**) and maps the submitted values to the configured fields.
5. The flow sends an approval request to configured approver(s). The decision is evaluated through the approval-state condition.
6. Email notifications are sent and the network record is updated according to the configured approved/rejected flow paths.
7. Authorized requesters and IT/network staff can track the request using ServiceNow records and status information.

User Stories:

These user stories are based on the project scope provided. Priorities and release labels are suggested planning values; acceptance criteria should be verified in the ServiceNow instance.

User Type	Functional Requirement (Epic)	Story Number	User Story / Task	Acceptance Criteria	Priority	Release
Requester	Request Submission	USN-1	As a requester, I can open the Network Request catalog item in the Service Portal so I can submit a network-service request.	The catalog item is available and a submitted request receives a ServiceNow request number.	High	Sprint-1
Requester	Request Details	USN-2	As a requester, I can provide the required network and contact details so the fulfilment team can process my request.	Configured mandatory fields must be completed; submitted values are available in the resulting record.	High	Sprint-1
Requester	Dynamic Form	USN-3	As a requester, I can choose New or Existing for Type of Connection so the form shows relevant fields.	Existing ID is visible when Existing is selected and hidden when New is selected, as configured in the UI Policy.	High	Sprint-1
Requester	Confirmation	USN-4	As a requester, I receive confirmation after submitting a network request so I know it was received.	A confirmation message or request number is displayed after successful submission.	High	Sprint-1
Approver	Approval Management	USN-5	As an approver, I can approve or reject a network request so it follows the configured approval process.	An approval record is created for the target network record and the decision is recorded.	High	Sprint-1
Requester / IT Team	Notifications	USN-6	As a requester or relevant team member, I receive configured email notifications so I know when action is needed or status changes.	The flow generates email notifications for configured recipients; generated messages can be checked in email logs.	Medium	Sprint-1
Network Fulfilment Team	Fulfilment	USN-7	As a network team member, I can view request details in a centralized network record so I can process requests consistently.	The Network Database record contains mapped fields and is accessible to authorized users.	High	Sprint-1
Flow Administrator	Workflow Automation	USN-8	As a flow administrator, I can automate variable retrieval, record creation, approvals, emails, and record updates in Flow Designer.	Flow execution details show configured actions and approval branches running as expected in test scenarios.	High	Sprint-1
ServiceNow Administrator	Access Control	USN-9	As an administrator, I can use ACLs and roles to control access to network request records.	Authorized users can perform permitted operations; unauthorized access is restricted.	Medium	Sprint-2
ServiceNow Administrator	Configuration	USN-10	As an administrator, I can maintain catalog variables, UI Policies, and flow conditions as requirements change.	Configuration changes behave as intended in form tests and do not break the request flow.	Medium	Sprint-2

Note: Confirm exact field names, approval recipients, email recipients, and test results against your ServiceNow instance before final submission.
