Ideation Phase

Define the Problem Statements

Date	12 October 2026
Project Name	Automated Network Request Management in ServiceNow
Maximum Marks	2 Marks

Customer Problem Statement Template:

Create a problem statement to understand the customer's point of view. This helps identify the challenges faced by people requesting network access or changes and by the team responsible for processing those requests.

Phrase	What to describe	For this project
I am	Describe the customer with 3–4 key characteristics.	An employee/requester or a network support team member.
I'm trying to	List the outcome or job the customer wants to achieve.	Submit, approve, track, and fulfil a network connection or network change request.
But	Describe the problems or barriers that stand in the way.	Requests may arrive through informal messages, with unclear status, missing details, or delayed approvals.
Because	Explain the root cause of the problem.	There may be no standard catalog form, automated approval flow, central request record, or consistent assignment process.
Which makes me feel	Describe the customer's emotions or the impact.	Requesters feel uncertain about progress; support teams feel overloaded and may miss or delay requests.

Problem Statements:

The following problem statements are specific to the Automated Network Request Management in ServiceNow project.

Problem Statement (PS)	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	An employee or requester	submit a new network connection request or request a change to an existing connection and know its progress.	there may be no standard request form or easy way to check status after submission.	requests can be sent informally and may lack required details, a central record, clear ownership, or automated notifications.	uncertain and frustrated about whether the request was received, approved, or completed.
PS-2	A network support or fulfilment team member / approver	review, approve, prioritize, assign, and complete network requests accurately and on time.	requests may arrive in different formats, approval follow-up may be manual, and the team may not have a consistent view of request details and status.	there is no integrated workflow connecting the Service Catalog, Flow Designer, approval process, notifications, and the network request record.	overloaded and concerned that requests could be delayed, duplicated, or missed.

Project solution direction: Use a Service Catalog item named “Network Request”, capture request details in a structured form, create and maintain records in the network database, route approval through Flow Designer, send notifications, and update the request status for tracking.
