FUNCTIONAL & PERFORMANCE TESTING TEMPLATE

Model Performance Test

Automated Network Request Management in ServiceNow

Date	Project Name	Maximum Marks
12 October 2026	Automated Network Request Management in ServiceNow	4 Marks

Test Scenarios & Results

The project is a ServiceNow workflow automation solution rather than a generative-AI model. This document therefore applies the reference template to functional, reliability and performance checks of the request workflow. No benchmark results are claimed until measured in the instance.

Test ID	Test type	Procedure / input	Expected result	Measured result
FT-01	Functional	Submit a valid Network Request.	Request and custom record are created; key values map correctly.	Pending execution
FT-02	Functional	Select Existing connection.	Existing ID field visibility/mandatory rules behave as configured.	Pending execution
FT-03	Functional	Approve a standard request.	Approval state and fulfilment path update correctly.	Pending execution
FT-04	Functional	Reject a sensitive request.	Rejected state and requester notification are recorded.	Pending execution
FT-05	Security	Attempt access using a requester role.	Unauthorized records/fields are not exposed.	Pending execution
PT-01	Performance	Submit a small baseline batch of representative requests in a test instance.	Capture submission response, flow duration and errors.	Record actual timings
PT-02	Reliability	Repeat request scenarios with varied approval paths.	No silent failures; execution details explain exceptions.	Pending execution
PT-03	Notification	Trigger configured emails on key state changes.	Expected recipients and content appear in email logs.	Pending execution

Suggested measurements

- Catalog submission response time (seconds).
- Flow execution duration (seconds).
- Successful record creation rate (%).
- Correct approval routing rate (%).
- Notification delivery rate (%).
- Error count and recovery time.

Evaluation note

Run performance tests only in an approved non-production environment and avoid generating load that could affect a shared instance. Report sample size, environment, date and actual measured values.
