PROJECT DESIGN PHASE

Problem – Solution Fit Template

Automated Network Request Management in ServiceNow

Date	Project Name	Maximum Marks
12 October 2026	Automated Network Request Management in ServiceNow	2 Marks

Problem – Solution Fit Template

User / stakeholder	Problem or need	Proposed feature	Expected value
Requester	Does not know where to submit or how to track a network request.	Network Request catalog item in Service Portal with status visibility.	A consistent entry point and fewer follow-up messages.
Network fulfiller	Receives incomplete or inconsistent request details.	Structured variables, required fields and custom-table mapping.	Better-quality handoff and less clarification.
Approver	Approval requests can lack context or have unclear ownership.	Conditional approval routing with approval reason and audit trail.	More consistent and traceable decisions.
ServiceNow admin	Manual steps are difficult to monitor and maintain.	Flow Designer orchestration, execution details and reusable configuration.	Improved maintainability and troubleshooting.
Security/compliance	Sensitive changes need policy checks and evidence.	Role-based access, required approvals and audit history.	Stronger governance and accountability.

Fit hypotheses to validate

- Requesters can complete the catalog form without help using the field labels and examples.
- Conditional fields reduce irrelevant questions while retaining required technical details.
- Configured approvers match the intended policy for each request scenario.
- Flow Designer removes selected manual handoffs without obscuring accountability.
- The request state and email notifications give stakeholders sufficient progress visibility.

Validation method

Run scenario-based demonstrations with a requester, manager/security approver and network fulfiller. Record task completion, missing-data issues, routing accuracy, notification results and user feedback. Use measured results from testing rather than assumed benefits.
