PROJECT DESIGN PHASE-II

Solution Requirements (Functional & Non-functional)

Automated Network Request Management in ServiceNow

Date	Project Name	Maximum Marks
12 October 2026	Automated Network Request Management in ServiceNow	4 Marks

Functional Requirements

ID	Requirement	Description	Priority
FR-01	Catalog intake	Users can submit a Network Request catalog item in Service Portal.	High
FR-02	Input validation	Required fields and formats are validated before submission.	High
FR-03	Dynamic fields	Existing-connection details appear only when the relevant choice is selected.	Medium
FR-04	Record creation	Submission creates a request record in the custom Network Database table and retains the RITM reference.	High
FR-05	Approval routing	Flow Designer requests the required manager/security/group approvals based on request conditions.	High
FR-06	Notifications	Requester and relevant teams receive configured status emails.	High
FR-07	Task assignment	Approved requests can generate or update fulfilment tasks for the network team.	High
FR-08	Status tracking	Authorized users can view request state, approval state and key timestamps.	High
FR-09	Auditability	Approval decisions and key lifecycle changes are retained for review.	High
FR-10	Access control	ACLs restrict access to sensitive records and fields by role.	High

Non-functional Requirements

Area	Requirement
Security	Use role-based access and least privilege; avoid exposing sensitive network details to unauthorized users.
Usability	Use clear labels, helpful instructions, logical field order and meaningful validation messages.
Reliability	Handle rejected approvals, missing data and flow failures without silently losing requests.
Maintainability	Prefer Flow Designer, catalog configuration and UI policies over unnecessary custom scripting.
Performance	Keep forms and flows efficient; test realistic request volumes in the target instance.
Auditability	Record approvals, state changes and operational events in platform records/logs.
Scalability	Support additional request categories, approval conditions and future integrations.

Business rules

- A request must not progress to fulfilment until all required approvals are complete.
- The Existing ID field should be displayed only when the user selects Existing connection; exact mandatory behaviour should follow the configured policy.
- Only authorized roles may view or update sensitive network request details.
- Approval rejection must result in a defined state and requester notification.
- Every submitted request should remain traceable to its originating Service Catalog request item.

Acceptance criteria

- A valid submission creates the expected request and structured custom-table record.
- Conditional fields respond correctly to the selected connection type.
- Approval routing matches the configured request conditions.
- Approve and reject paths update the request as designed and send expected notifications.
- Role-based access checks and audit review pass before deployment.
