PROJECT DESIGN PHASE-II

Technology Stack (Architecture & Stack)

Automated Network Request Management in ServiceNow

Date	Project Name	Maximum Marks
12 October 2026	Automated Network Request Management in ServiceNow	4 Marks

Technical Architecture

Technology / ServiceNow capability	Usage in this project	Notes
ServiceNow Service Catalog	Catalog item and request variables	User-facing request intake.
Service Portal	Portal route for Network Request submission	The supplied project procedure uses the instance URL with /sp.
Catalog Variables / Variable Sets	Requester details, contact information, connection type and related fields	Use consistent variable names for Flow Designer mapping.
Catalog UI Policies	Conditional visibility and mandatory behaviour	Example: show Existing ID when connection type is Existing.
Custom tables	Network Database; Network Task if implemented	Use clear field names, reference fields and state values.
Flow Designer	Get Catalog Variables, Create Record, Ask for Approval, Send Email, Update Record and If/Else logic	Primary automation mechanism.
Approvals	Manager, network security or group approval	Route based on request category and sensitivity.
Access Control Lists (ACLs)	Read/write protection for records and fields	Test with non-admin roles.
Email and system logs	Notifications and delivery troubleshooting	Verify sent/received status and recipient resolution.
Reporting / dashboards	Request volume, approval time, fulfilment time and backlog	Future or optional enhancement based on available data.

Design principles

- Prefer platform configuration and Flow Designer before adding custom scripts.
- Use a consistent naming convention for custom fields and tables.
- Document the mapping from catalog variables to custom-table fields.
- Keep test and production configuration controlled and review deployment changes.
- Do not claim integration or measured performance results unless they have been implemented and verified.
